1 About this Report

1.1 Project Type

1.2 Summary of the Paper

1.2.1 What the problem is

1.2.2 Why it is important

1.2.3 How you solve the problem

1.2.4 What we find

1.3 Data

We utilize data obtained from the replication files available in the data archive on Professor Daron Acemoglu's homepage. This dataset consists of a large panel of 175 countries. The sample size is 9,384, and the number of variables is 1,177. A list of variables is provided in the appendix.

```
data <- read_dta("data/raw/DDCGdata_final.dta")

summarize_data <- function(data, n = 10) {
  cat("Sample size (number of rows):",
    nrow(data), "\n")
}
```

```

cat("Number of variables (columns):",
    ncol(data), "\n")
}

summarize_data(data)

```

Sample size (number of rows): 9384
Number of variables (columns): 1177

1.4 Empirical Methods

Here, we will briefly explain the empirical methods we use for replication. The original paper used a number of empirical methods to strengthen the robustness of the results. Among them, we reproduce three methods¹.

1.4.1 Event Study (Figure.1)

First, we will conduct the following event study.

1.4.2 Dynamic Liner Panel Model (Table.2)

Next, we will estimate the following dynamic linear panel model.

$$y_{ct} = \beta D_{ct} + \gamma_1 y_{ct-1} + \alpha_c + \delta_t + \epsilon_{ct}, \quad (1)$$

$$y_{ct} = \beta D_{ct} + \sum_{j=1}^2 \gamma_j y_{ct-j} + \alpha_c + \delta_t + \epsilon_{ct}, \quad (2)$$

$$y_{ct} = \beta D_{ct} + \sum_{j=1}^4 \gamma_j y_{ct-j} + \alpha_c + \delta_t + \epsilon_{ct}, \quad (3)$$

$$y_{ct} = \beta D_{ct} + \sum_{j=1}^8 \gamma_j y_{ct-j} + \alpha_c + \delta_t + \epsilon_{ct}, \quad (4)$$

where y_{ct} is the log of GDP per capita in country c at time t and D_{ct} is a dummy variable that takes the value 1 if country c is a democracy at time t and 0 otherwise.

1.4.3 Instrumental Variable (IV) Method (Table.6)

Finally, we will perform the instrumental variable method. The instrumental variables used in this analysis are as follows.

$$Z_{ct} = \frac{1}{|I_c|} \sum_{c^* \in I_c} D_{c^*t}. \quad (5)$$

¹We also worked on Arellano Bond estimation in table.2. However, it took an enormous amount of computation time and the results obtained were quite different from the original results. In other words, replication failed. However, in the belief that it is desirable to disclose the entire analysis process and results, we disclose the analysis code and results in the appendix.

Using this instrumental variable, we will perform the following 2SLS estimation.

$$\begin{aligned}
 y_{ct} &= \beta D_{ct} + \sum_{j=1}^p \gamma y_{ct-j} + \alpha_c + \delta_t + \epsilon_{ct}, \\
 D_{ct} &= \sum_{j=1}^q \pi_j Z_{ct-j} + \sum_{j=1}^p \phi_j y_{ct-j} + \theta_c + \mu_t + v_{ct}
 \end{aligned} \tag{6}$$

2 Replication

Table 3: List of Variables

variable	label
country_name	Country name
wbcode	World Bank country code
year	Year (from 1960 to 2010)
gdpper capitaconstant2000us	GDP per capita (constant 2000 US\$, from World Bank)
lp_bl	Percentage of population with at most primary (Barro-Lee)
ls_bl	Percentage of population with at most secondary (Barro-Lee)
lh_bl	Percentage of population with tertiary education (Barro-Lee)
taxratio	Tax revenue as a share of GDP (from Hendrix)
region	Geographical region
wbcode2	Generated numeric country code
demCGV	Democracy measure by CGV
demBMR	Democracy measure by BMR
yeardem	Identifier for a democratization during this year
yearrev	Identifier for a reversal to autocracy during this year
secenr	Secondary enrollment from World bank
prienr	Primary enrollment from World Bank
tradewb	Exports plus Imports as a share of GDP from World Bank
mortnew	Child mortality per 1000 births from World Bank
ginv	Gross investment as a share of GDP
rtfpna	TFP at constant national prices (2005=1) from PWT
y	log of GDP per capita in 2000 constant dollars (multiplied by a 100)
dem	Democracy measure by ANRR
