1 About this Report

- 1.1 Project Type
- 1.2 Summary of the Paper (Honoka Ohtani)
- 1.2.1 What the problem is
- 1.2.2 Why it is important
- 1.2.3 How you solve the problem
- 1.2.4 What we find
- 1.3 Data (Shoya Abe)

We utilize data obtained from the replication files available in the data archive on Professor Daron Acemoglu's homepage. This dataset consists of a large panel of 175 countries. The sample size is 9,384, and the number of variables is 1,177. A list of variables is provided in the appendix.

```
data <- read_dta("data/raw/DDCGdata_final.dta")
summarize_data <- function(data, n = 10) {
  cat("Sample size (number of rows):", nrow(data), "\n")
  cat("Number of variables (columns):", ncol(data), "\n")</pre>
```

}

summarize_data(data)

Sample size (number of rows): 9384 Number of variables (columns): 1177

1.4 Empirical Methods (Shoya Abe)

Here, we will briefly explain the empirical methods we use for replication. The original paper used a number of emiprical methods to strengthen the robustness of the results. Among them, we reproduce three methods¹.

1.4.1 Event Study (Figure.1)

First, we conduct the event study. We estimate the average treatment effect (ATT) for the treated group using the procedure described below.

First, let T_c denote the year in which a given country experienced the democratization event. For any country c and year t, we define the relative year as

$$\tau_{c,t} = t - T_c$$
.

Then, taking the outcome y in the year immediately preceding democratization (i.e., when $\tau = -1$) as the baseline, the outcome of interest is defined as

$$gdpDiff_{c,t} = y_{c,t} - y_{c,T_c-1}.$$

Next, we estimate the following regression model using the control group that did not experience democratization:

$$\operatorname{gdpDiff}_{c,t} = \sum_{\tau=-15, \ \tau \neq -1}^{30} \beta_{\tau} \mathbf{1} \{ \tau_{c,t} = \tau \} + \epsilon_{c,t}.$$

The estimated coefficient $\hat{\beta}_{\tau_{c,t}}$ from (3) can be interpreted as the counterfactual outcome for country c in year t in the absence of democratization. Therefore, the average difference between the observed outcome and this counterfactual outcome provides an estimate of the ATT for relative year τ , which is calculated as

$$\mathrm{ATT}(\tau) = \frac{1}{N_{\tau}^{\mathrm{treated}}} \sum_{\substack{(c,t) \in \mathrm{treated} \\ \tau_{c,t} = \tau}} \left(\mathrm{gdpDiff}_{c,t} - \hat{\beta}_{\tau} \right).$$

¹We also worked on Arellano Bond estimation in table.2. However, it took an enormous amount of computation time and the results obtained were quite different from the original results. In other words, replication failed. However, in the belief that it is desirable to disclose the entire analysis process and results, we disclose the analysis code and results in the appendix.

1.4.2 Dynamic Liner Panel Model (Table.2)

Next, we will estimate the following dynamic linear panel model.

$$y_{ct} = \beta D_{ct} + \gamma_1 y_{ct-1} + \alpha_c + \delta_t + \epsilon_{ct}, \tag{1}$$

$$y_{ct} = \beta D_{ct} + \sum_{j=1}^{2} \gamma_j y_{ct-j} + \alpha_c + \delta_t + \epsilon_{ct}, \qquad (2)$$

$$y_{ct} = \beta D_{ct} + \sum_{j=1}^{4} \gamma_j y_{ct-j} + \alpha_c + \delta_t + \epsilon_{ct}, \tag{3}$$

$$y_{ct} = \beta D_{ct} + \sum_{j=1}^{8} \gamma_j y_{ct-j} + \alpha_c + \delta_t + \epsilon_{ct}, \tag{4}$$

where y_{ct} is the log of GDP per capita in country c at time t and D_{ct} is a dummy variable that takes the value 1 if country c is a democracy at time t and 0 otherwise.

1.4.3 Instrumental Variable (IV) Method (Table.6)

Finally, we will perform the instrumental variable method. The instrumental variables used in this analysis are as follows.

$$Z_{ct} = \frac{1}{|I_c|} \sum_{c^* \in I_c} D_{c^*t}.$$
 (5)

Using this instrumental variable, we will perform the following 2SLS estimation.

$$y_{ct} = \beta D_{ct} + \sum_{j=1}^{p} \gamma y_{ct-j} + \alpha_c + \delta_t + \epsilon_{ct},$$

$$D_{ct} = \sum_{j=1}^{q} \pi_j Z_{ct-j} + \sum_{j=1}^{p} \phi_j y_{ct-j} + \theta_c + \mu_t + v_{ct}$$
(6)

2 Replication
